Ward**

FROM ICU TO RECOVERY

An 81-year-old woman was admitted in a critical condition with a obstructed hernia and severe lung infection due to aspiration. She required urgent surgery and intensive care. After surgery, her recovery was complicated by irregular heart rhythm, severe chest infection, and delayed bowel movement, making feeding difficult. She also developed a serious bloodstream infection (fungal), which required advanced treatment.

With timely surgical care, intensive monitoring, appropriate antibiotics and antifungal treatment, nutritional support, and dedicated physiotherapy, her condition gradually improved. Step by step, her breathing stabilized, infection came under control, and her digestive system started recovering.

Today, she is stable, taking oral diet, and on the path to recovery. This case highlights the importance of early intervention, teamwork, and comprehensive ICU care.

TIMELY RESCUE STORY

A 53-year-old woman with rheumatoid arthritis was brought to our hospital in a critical condition after side effects of methotrexate. This led to severe mouth ulcers, throat pain, extreme weakness, and a dangerous drop in blood counts, putting her at high risk of life-threatening infections.

She was immediately admitted and managed with a specific antidote, intensive supportive care, infection control, and close monitoring in a high-dependency setting. Nutrition, pain relief, and blood count recovery were carefully handled by a multidisciplinary team.

With timely intervention and meticulous care, her condition gradually improved, her blood counts recovered, and she was safely discharged.

This case highlights the importance of correct medication use and how early treatment can be life-saving.

Physiotherapy Department Fall Prevention Step-Up Project

Mrs. Shakuntala

A 69-year-old female patient, has been experiencing balance and coordination difficulties due to hemiparesis for the past 20 years. She was advised to undergo physiotherapy for balance training and strengthening. She has been attending the physiotherapy department for the past 10 days. During this period, there has not been a single fall or loss of balance. This is a significant achievement for her, as she used to fall daily. She has also shown remarkable improvement in strength and coordination.

Mrs. Sheela Trivedi

60 years old female patient presented with right frozen shoulder with severe pain and significant restriction in shoulder movements affecting her daily activities for 6 months. With one and half months of dedicated physiotherapy along with a corticosteroid injection she showed remarkable improvement, achieving 99% pain relief and full range of motion. Her recovery reflects the positive impact of timely intervention and consistent rehabilitation.

Diet Department

Ansuyaben Kandoliya - Diabetes Remission

A middle-aged female patient managing seva and household responsibilities, was experiencing low energy, weight gain, and newly diagnosed diabetes and dyslipidemia. After following a structured millet-based diet excluding wheat and rice for 3 months, she achieved a 9 kg weight loss, discontinued diabetes and cholesterol medications based on improved reports, and experienced significant improvements in energy, stamina, and overall well-being.

Pravinaben Sakhpariya - Transformation at 62

A 62-year-old female patient joined the Swasth Lifestyle Transformation Program with diabetes, excess weight, joint pain, and digestion issues, and within just 11 weeks achieved 6 kg weight loss, visible inch loss, and reduced her diabetes medication by half; she continues to maintain her improved health through consistent lifestyle habits, demonstrating that lasting change is possible at any age.
